Nevaeh Dickerson

dickersonng@vcu.edu | (571) 528-4221 | https://www.linkedin.com/in/nevaeh-dickerson/

Summary

Computer Science student with experience in machine learning and cybersecurity. Trains models on large datasets, checks the data first, and builds dashboards and detection rules that make security events easier to review.

Education

Virginia Commonwealth University | Richmond, VA **Expected Graduation: May 2029**

Bachelor of Science in Computer Science | *Concentration in Data Science* | *Minor in Artificial Intelligence*

Dean's List | GPA: 3.53

Relevant Coursework: Data Structures | Discrete Structures | Linear Algebra | Statistics & Probability | Object-Oriented Programming (Java) | Intro to Problem Solving (Python) | Essentials of AI | Computing and Data Ethics

Skills

Python, Java, SQL, pandas, NumPy, scikit-learn, XGBoost, TensorFlow/Keras, data validation, model evaluation, Git/GitHub, Linux, Elasticsearch, Kibana, SIEM, detection rules, LangChain, prompt engineering

Projects

Allstate Auto Claims Severity | Break Through Tech AI Studio **August 2026 – Present**

https://github.com/Break-Through-Tech/Allstate-1D-predicting-auto-claims-severity

- As a Break Through Tech AI Studio fellow, used an Allstate auto-claims case of 188,318 claims to explore how an insurer could estimate final payout early enough for reserve planning, during the months repairs and legal outcomes take to settle.
- Validated the dataset, passing 18 data checks, and found average claim cost rose 64% from the low to the high range of one input field.
- Trained a random forest and an XGBoost model on a 70/15/15 split and compared them with simple cost baselines on 28,248 held-out claims. Average dollar error was $1,292 for the forest and $1,172 for XGBoost, versus $1,827 for guessing the typical claim cost. Training stopped after that first comparison.

Experience

Break Through Tech AI Program | AI Fellow **April 2026 – Present**

- Trained, tuned, and compared logistic regression, k-nearest neighbors, decision trees, and a TensorFlow/Keras neural network.
- Built a retrieval-augmented chatbot in LangChain, including document ingestion, embeddings, vector retrieval, and answer generation.

Hive Systems | Cybersecurity Consulting Intern **May 2026 – July 2026**

- Built Kibana dashboards for failed logins, credential-compromise activity, and system health so high-priority events were visible for review.
- Classified Auth0 detection rules into baseline, signal, and critical, and validated Auth0 and AWS CloudTrail log ingestion.

AI Cybersecurity Startup | Cyber Software Engineer Intern **June 2023 – August 2025**

- Built Kibana dashboards on Elasticsearch and Logstash data to show security risks and support decisions about which events to investigate.
- Used the OpenAI API to collect vulnerability records from NVD, AlienVault, AbuseIPDB, and VirusTotal and write short summaries.
- Helped build SIEM and SOAR systems, wrote detection rules, triaged alerts, and hardened Linux access with SSH two-factor authentication and a UFW firewall.

Leadership and Student Organizations

Society of Women Engineers | Contact Chair | VCU **April 2026 – Present**

- Communicate key SWE updates to E-Board and chapter members through meetings and weekly newsletters highlighting scholarships, deadlines, conferences, and professional opportunities.

Undergraduate Teaching Assistant | Essentials of AI (CMSC 225) | VCU **August 2026 – Present**

- Grade weekly 1,100+ word discussions for 115 students on AI concepts, providing thoughtful, rubric-based feedback.
