Nevaeh Dickerson

dickersonng@vcu.edu | (571) 528-4221 | https://www.linkedin.com/in/nevaeh-dickerson/

Summary

Computer Science student and Cornell Tech AI Fellow focused on machine learning, data analysis, and security review.

Education

Virginia Commonwealth University | Richmond, VA **Expected Graduation: May 2029**

Bachelor of Science in Computer Science | *Concentration in Data Science* | *Minor in Artificial Intelligence*

Dean's List | GPA: 3.53

Relevant Coursework: Data Structures | Discrete Structures | Linear Algebra | Statistics & Probability | Object-Oriented Programming (Java) | Intro to Problem Solving (Python) | Essentials of AI | Computing and Data Ethics

Skills

Java, Python, SQL, pandas, NumPy, scikit-learn, TensorFlow/Keras, exploratory data analysis, data validation, feature engineering, model evaluation, LangChain, embeddings, retrieval-augmented generation, prompt engineering, Git/GitHub, Cursor, Elasticsearch, Kibana, Linux

Projects

Allstate Auto Claims Severity ML Project | Break Through Tech AI Studio **August 2026 – Present**

- As a Break Through Tech AI Studio fellow, used an Allstate auto-claims case of 188,318 claims to explore how an insurer could estimate final payout early enough for reserve planning, during the months repairs and legal outcomes take to settle.
- Validated the dataset, passing 18 data checks, and found average claim cost rose 64% from the low to the high range of one input field.
- Trained a random forest and an XGBoost model on a 70/15/15 split and compared them with simple cost baselines on 28,248 held-out claims. Average dollar error was $1,292 for the forest and $1,172 for XGBoost, versus $1,827 for guessing the typical claim cost. Training stopped after that first comparison.

Experience

Break Through Tech AI Program | AI Fellow **April 2026 – Present**

- Trained, tuned, and compared 4 supervised models: logistic regression, k-nearest neighbors, decision trees, and a TensorFlow/Keras neural network.
- Built a retrieval-augmented chatbot in LangChain, including document ingestion, semantic chunking, embeddings, vector retrieval, and answer generation.

Hive Systems | Cybersecurity Consulting Intern **May 2026 – July 2026**

- Built Kibana dashboards for failed logins, credential-compromise activity, and system health so high-priority events were visible for review.
- Classified Auth0 detection rules into 3 tiers (baseline, signal, and critical), validated Auth0 and AWS CloudTrail log ingestion, and applied a shared Wazuh tag scheme so alerts could be compared across clients.

AI Cybersecurity Startup | Cyber Software Engineer Intern **June 2023 – August 2025**

- Built Kibana dashboards on Elasticsearch and Logstash data to visualize security risks and support decisions about which events to investigate.
- Integrated the OpenAI API into automated workflows to collect vulnerability records from NVD, AlienVault, AbuseIPDB, and VirusTotal and write contextual summaries.
- Helped build production SIEM and SOAR systems, wrote detection rules, triaged security and operational alerts, and hardened Linux access with SSH two-factor authentication and a UFW firewall.

Leadership and Student Organizations

Society of Women Engineers | Contact Chair | VCU **April 2026 – Present**

- Communicate key SWE updates to E-Board and chapter members through meetings and weekly newsletters highlighting scholarships, deadlines, conferences, and professional opportunities.

Undergraduate Teaching Assistant | Essentials of AI (CMSC 225) | VCU **August 2026 – Present**

- Grade weekly 1,100+ word discussions for 115 students on AI concepts, providing thoughtful, rubric-based feedback.
